DESCRIPTION

Cooling system filler device

It is essential to change the liquid and bleed the circuit to guarantee the heat conditions required for engine operation. It is vital to maintain the circuit in good condition and to check the liquid. After the liquid has been bled, this device is used to create a vacuum in the circuit. This negative pressure then makes it possible to fill the cooling circuit completely, automatically and quickly without any air bubbles. Built-in negative pressure gauge. Max. pressure -0.85 bar. Universal rubber for connection on the expansion tanks and radiators. Connection to 1/4" air coupling. 1.5m pipes. Weight: 1.260 kg.
